on the methodical council of  
therapeutic disciplines  
Protocol № 4 from 21.01.2020  
Chairman \_\_\_\_\_  
prof. Stanislavchuk M.A.

**Instruction to the station №10**  
**«Standardized patient in the clinic of infectious diseases»**

At the station, the student must greet and introduce himself, present a student identification card and a route sheet to the teacher.

A student receives a clinical problem, which involves communication with the patient (tutor), who needs to examine the complaints, their details and anamnestic data, taking into account the epidemiologic anamnesis.

During working with a patient (tutor):

The student must greet and introduce himself and ask the patient how he can address him. After receiving information about the patient's name, ask the permission to interview him.

**NB! Pay attention! When dealing with a patient, student's  
communicability must be assessed separately**

Interview the patient's complaints, detail them, and analyze the anamnestic data.

**NB! Pay attention! When working with a patient, the ability to  
elaborate complaints and interview anamnestic data is assessed  
separately.**

The patient reports immediately all complaints that concern him, which automatically indicates no other complaints.

The patient may inquire: "An explanation, please, what is with me?", Indicating that the patient does not have information about which the student is too inquisitive

interrogated, thus making it clear that it is necessary to proceed to the next step in the survey. The student must give a brief answer to the patient and continue to perform the next task.

The student receives data from the objective examination of the patient in a paper version (clinical task) in addition to the task.

When working with the clinical problem:

it is necessary to analyze the data of the objective patient survey, which are given,

- to interpret the data of the laboratory-instrumental examination of the patient,
- to make a preliminary diagnosis
- be able to designate methods of specific diagnosis to confirm the diagnosis;
- determine the tactics of patient management,
- Appoint a treatment for the patient, calling the group of drugs and the representative.

After completing the assignment or ending the time at the station, return the task to the teacher, pick up your route card with a mark on the station and leave the station.
